## Signs of hydrocele

Summary A hydrocele is a collection of serous fluids between the layers of the membrane (tunica vaginalis) that surrounds the testicle or along the sperm cord. Rarely, collecting similar liquids can occur in females along the Nuck channel. Common in infants and infants. Most pediatric hydroceles are congenital and, in most cases, resolve within the first year of life. It can occur in adult men where there are secondary to minor trauma, infection, testicular torsion, epididymite, varicocele operation, or testicular tumor. The main symptom is a painless swollen scrotum on 1 or both sides, which feels like a balloon filled with water. Treatment depends on the patient's age and the degree of discomfort caused by hydrocele. Surgery will only be performed if the hydrocele is causing problems. Hydrocele is a collection of serous fluids between the layers of the membrane (tunica vaginalis) that surrounds the testicle or along the sperm cord. Rarely, collecting similar liquids can occur in females along the Nuck channel. There are 2 types of hydrocele: communicating and not communicating (simple). In communicating hydrocele, a patented vaginalis process connects the peritoneum with the vaginalis tunic, which allows the peritoneal fluid to flow freely between both structures. Communication Hydrocele Created by BMJ Group If the connection is large, the abdominal content (bowel, bladder or omentum) can enter into the groin, and this complication is called an inguinal hernia. Inguinal hernias are classified in direct or indirect, based on the sac report to the lower epigastric artery. In a direct inguinal hernia, the hernial sac is found medial for the artery and deep inguinal ring. In an indirect inguinal hernia, the hernial sac is located lateral to the artery (see our complete content on the inguinal hernia). [1] International group of endosurgeryIPEG guidelines for inguinal and hydrocele hernia. J Laparoendosc Adv Surg Tech A. 2010;20:x-xiv. 2010;20:x-xiv. tool=bestpractice.com A non-communicative or simple hydrocele occurs when the vaginalis processus is closed and fluid is produced by the vaginalis tunic that is absorbed. Hydrocele non communicative Created by BMJ Groupscrotal masstransillumination enlargement of the scrotal mass after activityvariation in mass scrotal during the dayMore key diagnostic factors Male sexual prematurity and low birthinfants weight
