Android disable part of touch screen

How to disable touch screen android. How to disable touch screen.

Touch screens grow in popularity throughout, from personal computers to ATMs, but the iPhone has innovation. The difference between iPhone screens and most other touch screens is made to respond to more than one touch at a time and touch movement. For example, some of the commands are sent by moving the thumb and the index finger to part or together on the screen. The technology that allows this type of touch screen is based on capacitive circuits, in which the touch of a finger completes the circuit to send an electronic message to the "brain" of the phone. The capacitive system requires the user to touch with a finger, rather than a stylus or other non-conductive material. The iPhone screen uses one of the two slightly different systems to send individual messages from each of the points on the screen. There is a self-capacity system, in which there is a layer of separate electrodes, each able to perceive the touch and send his message; And there is a system of mutual capacity, which uses two separate layers. A layer has driving lines, which carry the electric current; The other has detection lines at an angle of 90 degrees to the guidelines. The detection lines respond to the touch to the nodes between the two layers of lines, with a signal sent by each node. The types of iPhone screens start with the LCD layer (what the user sees) connected to the phone's body. This is covered by a layer of glass substrate. In the reciprocal capacity system, the detection lines are linked to this glass level and followed by the layer of the guidelines. In the self-capacity system, the electrode layer is at the top of the glass substrate. In both cases, there is a layer of bond, a protective cover and finally, an anti-reflective coating. Never lying in bed trying to send a text message just to fight your screen for what you want to be? Yes, well, it becomes old quickly trying to do something in vertical mode while your display is passing in horizontal mode, right? Fortunately with a few simple clicks you can take care of this problem and lock the screen in vertical mode. Open the device settings Scroll to the Display Check / Auto-rotate auto-rotate screen Have the checked box Allow the phone to determine based on the way it is held in the direction that the screen should go in progress, and deselect the box It will block it in portrait mode for you. Source: Andrew Martonik / Android Central There are some aspects of our phone we expect. The home screen is a customizable canvas that we can add apps and widgets to, the app drawer hosts all the applications that are downloaded and the lock screen shows the time and notifications without giving full access to the rest of the phone. The lock screen is a great way to stay informed about messages, calls, e-mails, etc., also added a useful level of safety to the device. However, if you don't care about the lock screen and find it does nothing but slow down, you can disable it. We will talk more if this is a good idea below, but before it's the first thing, here's what the process is to disable the lock screen on Android. Open the settings on the phone. Touch security. Touch the screen lock. Source: Joe Maring / Android Central Enter your PIN / PASSWORD. Touch nobody. Tap Yes, remove. Source: Joe Maring / Android Central Now, every time you wake up your Android phone, you will be immediately taken to the main screen. Likewise, if you ever find yourself wanting to reactivate the lock screen, just follow the previous steps again and choose if you want to lock your phone with a shot, a model, a PIN or password. Is it safe to do? Source: Central as you can see, disable the lock screen on your Android phone is a fairly easy task. However, since this is removing an important level of security from your device, is something you should do? All that it reduces you to decide. to decide. Do something less secure, you're making technically more vulnerable to being tampered with. If someone tears the phone and there is no locking screen to protect it, they have immediate access to all your apps, contacts and other personal information. From that perspective, it probably makes sense for most people to enable the lock screen. Even if it's just a four-digit Pin that is easy to remember, something is better than anything. At the same time, if you really like the lock screen and put a lot of value to get to the home screen as quickly as possible, you are more than welcome to disable it. Everything you won't be aware that this makes your phone less secure, it starts directly on the home screen when you press the power button it is quite nice. The fingerprint sensors and face release systems have helped accelerate the act of exceeding the block screen, then you also keep this in mind before removing it totally. Because you (and your family) you should use two-factor authentication and a password manager Photo of courtesy: DJELICS / E+ / Getty Images If you have thought to update your computer, go to a touchscreen laptop can make it all easier, either That you â is doing graphic design work, games or get a sage ready for the lesson. There are lots of great advantages in making the touch-enabled flat screen laptop jump. Their familiar capabilities of pinch-to-zoom make it easier to read what is on the screen, and remissives to other TOUCH YOUTHING gestures that it is likely to be used if you are a smartphone user. Also, they give you the opportunity to type using a traditional keyboard when writing or to use a stylus and use the laptop as a notepad from the old school if you prefer the feeling of writing with a pen and a card. You will also discover that touchscreen laptops are equipped with superior quality displays, and it may also be interested in getting a break from using a trackpad. Ready to learn more about touch screen-enabled laptops? Take a look at these best options, we filled out to help make your shopping experience easier. While there is nothing wrong with the trusted traditional portable, you will discover that touchscreen laptops have benefits all theirs. Many of the models available today are equipped with 360-degree rotating keyboards, which allows you to open up and fold them completely to use them as a traditional tablet or laptop. Some of the other advantages that Touchscreens lead to the table include: Photo of courtesy: Laura Olivas / Moment / Getty Images The easier navigation - Laptop touchscreen allow you to launch and switch from an apps with the same efficiency you have on a tablet Or on your smartphone. Not only does this tend to be a faster method, but it is also useful if you ever verify a keyboard or mouse malfunction. Great for creativity, while artists can have a difficult time to draw with the use of a traditional mousepad, touchscreen laptops allow you to draw or write directly to the screen, almost like paper. This is also an important advantage for students, since it largely eliminates the need for a notebook or a binder for grip. Best view: You may be surprised to find out more vibrating colors appear on the screen of a touchscreen laptop compared to the screens of some traditional models. Some of these return to the materials that must be made touchscreen with to allow them to respond to the touch. These glassy materials tend to be less opaque than those used in regular portable computers screens, and, consequently, produce more colors In the past, some touchscreen laptops were infamous to drain the fastest and most heavy batteries more than their traditional counterparts. Fortunately, you will be happy to find out that it is no longer the case. Many of the laptops you will find here are among the lighter and more efficient devices on the market today.
