Vba code to combine excel files in a folder

RESOURCES FINANCE Success stories Excel products Don't forget to share this post you need to combine multiple Excel files? Maybe you have many different Excel workbooks you're working on, and want to manage in one place. Perhaps you want a master spreadsheet that refers to a few others. Maybe you shared a copy of the Excel file with your team, which has updated some parts of it, and you want to join the master file again. There are many methods to combine Excel files. Each method can be useful in its own way, depending on the case of use. So, without further delay, we pass through some of the most popular methods to merge Excel files. How to combine Excel files with manual copy? The simplest and simple way to join two files is to copy data from one file to another. 1.â, select the interval to copy or press Ctrl / Apple + A to select the entire sheet.2.â, press Ctrl / Apple + C to copy the interval.3.â, go through "" other spreadsheet and, if necessary, create a new sheet.4.â, select the location in which to paste the data and press Ctrl / Apple + V. While this method may be the fastest when it comes to spreadsheets smaller, becomes more risky and more complicated as the files grow. Human error is almost inevitable, and errors are destined to happen. That's why you should use this method only for personal use cases. How to combine Excel files using Move or Copy? You can use the Excel «Move or Copy» function to copy one or more Excel sheets from a job folder instantly. 1.â, Open Excel files.2.â, select the sheets you want to copy in the other workbook while holding down Ctrl / Apple and selecting the sheets. The selected sheets will be highlighted. You can deselect the sheets again by clicking again on them. Then select the last sheet to copy. All sheets will also be selected between the two selected sheets.4.â, right-click and select «Move or copy.â» A dialog box will appear. 5.â, Under «To book: â» Select the other file in which to move the data.6.â, for â «before the sheet: â», select where you want to insert the sheets. You can always reorganize your leaves later.7.â, press â «OK.â» Excel lets you refer to the cells in different Excel files or workbooks. This way you can combine Excel files by referring to them in the master file. 1.â, Open both Excel files.2.â, copy the first cell of the workbook to refer to.3.â, Go to the master.4 file, select the cell where you want to view the data and press the right mouse button.5.â, from the menu, select Paste Special> Paste Link. This will generate the formula you need. It will look like this: =[file.xlsx]sheet'!\$A\$1 6.â To display the other cells, change the formula from absolute reference to cell reference by removing the dollar signs (\$) so that it looks like: =[file.xlsx]sheet'!A1 7.â Copy and paste the formula into the others cells you want want While this method allows you to protect data using only file references instead of gluing values, it can be overly complicated. If you stop one of the formulas or accidentally delete one of the files, you will end up with many #REF! errors that may be difficult to fix. Also, when referring to blank cells, while you might think that they remain empty, the cells will display one zero "0" in the master sheet. There are, of course, solutions to hide the zeros in this case, but it is a further step that makes the method even more complicated. How to combine Excel files using power query? Power Query (Get & Transform) Allows you to import, edit and consolidate data in Excel. It can also be used to combine multiple Excel files by adding them to a folder: 1. Move all files you want to combine into a folder.2.â In Excel, go to the «Dates».3.â Press Get Data > From File > From Folder.4. â Browse and select the folder path.5. Press "Ok" 6. If the files are ready to be combined, press «Com If you want to manipulate the data before joining the files, press the button «Transform Data.» This will open the Query Editor, where you will have the opportunity to reorganize and filter data, manage rows and columns and more. The Get & Transform method could be one of the easiest to combine files from multiple sources together. Not only does it allow you to import Excel Workbooks, but you can also import other file formats, including text, CSV, XML, JSON, PDF and more. However, this feature is only available in all stand-alone versions of Excel 2016 or later Windows and Microsoft 365 subscriptions. This means that Mac users are unable to use this feature and will have to use VBA instead. How to combine Excel files using VBA? Excel VBA (Visual Basic for Applications) is programming language for Excel and all Microsoft Office products. This allows you to create macros to manipulate and automate your Excel processes. Don't worry. You won't have to learn a new programming language. You can use the pre-created macros below. 1. Open all Excel files you want to combine.2. â To open the VBA editor, use Windows Alt + F11 shortcut or Mac Opt + F11 or Fn + Opt + F11.3.â Go to Insert > Module. This will create a new module for the workbook.4.â Copy and paste one of the codes below depending on how you want to combine your worksheets: Combine all Excel files in a new workbook like single Sub CombineMultipleFiles sheets () On Error GoTo eh'declare variables to hold the object required Dim wbDestination As Workbook Dim wbSource As Workbook Source As Worksheet Dim wb As Workbook Dim sh As Worksheet Dim strSheetName As String Dim strDestName As StringThe update screen to speed up the things Application.ScreenUpdating = false false create a new workbook of destination Set wbDestination = Workbooks. Add 'get the name of the new workbook so as to exclude it from the underlying loop str DestName = wbDestination. Name 'now loop through each of the open workbooks to get data, but exclude your new book or personal macro workbook for each wb in Application. Workbooks If wb. Name E wb.Name < > "PERSONAL.XLSB" Then set wbSource = wb For each sh In wbSource. Worksheets sh.Copy After: = workbooks (strDestName). Sheets(1) Next sh End If Next wb's now close all open files except the new file and macro workbook Personal. For each wb in the application. Workbooks If wb. Name E wb.Name < > "PERSONAL.XLSB" Then wb. Close False End If Next wb 'remove sheet one from the target workbook Application. View alerts = fake sheets("Sheet1"). Clear the application. DisplayAlerts = True 'clean objects to release the memory Set wbDestination = Nothing Set wbSource = No Set wsSource = No Set wb = No 'turn on the screen the update when the full application. ScreenUpdating = False Exit Sub eh: MsgBox Err.Description End Sub Combine all Excel files in one sheet in a new workbook Sub CombineMultipleSheets() On GoTo error eh 'declare variables to hold the necessary objects Dim wbDestination As Workbook Dim wbSource As workbook Dim wsDestination As worksheet Dim wb As workbook Dim sh As worksheet Dim strSheetName As String Dim strDestName As String Dim iRws As Integer Dim iCols As Integer Dim TotRws As Integer Dim strEndRng As String Dim rngSource As Range's drop screen update to accelerate things Application. ScreenUpdating = False 'first create new target workbook Set wbDestination = Workbooks. Add 'get the name of the new workbook so as to exclude it from the underlying loop str DestName = wbDestination. Name 'now loop through each of the open workbooks to get data for each wb in the application. Workbooks If wb.Name < strDestName And wb.Name "PERSONAL.XLSB" Then wb.For each sh In wbSource. Worksheets 'get the number of rows and columns in sh sheet. Activate ActiveSheet. Cells.SpecialCells(xlCellTypeLastCell). Activate iRws = ActiveCell. Row iCols = ActiveCell. Column 'set the range of the last cell in the strEndRng sheet = sh.Cells(iRws, iCols). Address 'set the source range to copy Set rngSource = sh.Range("A1:" & strEndRng) 'find the last line in the target card wbDestination. Activate Set wsDestination = ActiveSheet wsDestination.Cells.SpecialCells(xlCellTypeLastCell). Select the Rws = ActiveCell tot. 'check if there arerows to paste data Se totRws + rngSource. Regatta.Conto > Destination. Remi. Then MsgBox "There are not enough lines to insert data into the consolidation worksheet." Go to the end If you add a row to paste on the next row down If totRws < 1 Then totRws = totRws + 1 rngSource. Copy Destination: =wsDestination.Range("A" & totRws) Next sh End If next wb 'now close all open files except what you wantwb In Application. Workbooks If wb.Name strDestName And wb.Name "PERSONAL.XLSB" Then wb.Close False End If Next wb 'clean up the objects to release the memory Set wbDestination = Nothing Set wbSource = Nothing Set wsSource = No Set wb = No 'turn on the screen the update when the full application. ScreenUpdating = False Exit Sub eh: MsgBox Err.Description End Sub Combine all Excel files into a single worksheet in an active workbook Sub CombineMultipleSheetsToExisting() On Error GoTo eh 'declare variables to hold the objects required Dim wbDestination As Workbook Dim wbSource As Workbook Dim wsDestination As Worksheet Dim wb As Workbook Dim sh As Worksheet Dim strSheetName As String Dim strDestName As String Dim iRws As Integer Dim iCols As Integer Dim totRws As Integer Dim rngEnd As String Dim rngSource As Range 'set the active workbook object for the destination book Set wbDestination = ActiveWorkbook 'get the name of the active file strDestName = wbDestination.Name 't GoTo eh End If 'aggiungi una riga da incollare sulla riga successiva in basso se non sei nella riga 1 If totRws 1 Then totRws = totRws + 1 rngSource.Copy Destination: =wsDestination.Range("A" & totRws) Next sh End If Next wb 'ora chiudi tutti i file aperti tranne quello che vuoi For Each wb In Application.Workbooks If wb.Name strDestName And wb.Name "PERSONAL.XLSB" Then wb.Close False End If Next wb 'pulisci gli oggetti per liberare la memoria Set wbDestination = Nothing Set wbSource = Nothing Set wsDestination = Nothing Set rngSource = Nothing Set wb = Nothing 'accendi lo schermo aggiornando COMPLETE APPLICATION. SCREENUPDATING = FALSE EXITS SUB EH: MSGBOX ERR.Description End Sub 5.â, 5. Press the PLAY button. This will open the "Macros" dialog .6 .6. 6. Select the macro and press "Run". While VBA can be extremely powerful, again, it is a programming language. This means that in addition to using pre-written macros, you should learn VBA Excel to create own or modify the existing ones, which comes with your challenges set. The Excel legacy shared workbook table allows. While Excel eventually replaced it with its new co-authoring functionality thanks to its numerous limitations, it is still possible to use it to combine shared copies of the same Excel file. First of all, you need to enable changes highlighting: 1. Announce tools> Track changes> Highlight changes to changes.2. Select the "Track changes during editing" box to enable tracking.3. Select when you want to start highlighting changes, for those who and for which the range of cells, if necessary. Leaving the boxes deselected, traced all changes in the workbook for all collaborators .4. Select if you want to enable the highlighting on the screen, which outlines the cells concerned in different colors for different users. This is only useful for workbooks with few changes since it only provides a rudimentary look at the changes. To join two different versions or copies of the same Excel workbook: 1. Go to Tools> Merge Workbooks.2. Select the Excel file you want to combine with your current one. The selected workbook must be a copy made from the same shared workbook and must maintain changes history for sufficient quantity of time to be able to unite them.3.- Press The data of the selected version of the spreadsheet will be applied to your current. If the "Track Edit" function is activated, the changes will be highlighted to review and choose whether to accept or reject them. Unfortunately, the shared workbook function has many limitations, which is why it was interrupted by Excel and replaced by their co-authenticity functionality. The feature that works on top of Excel files. It is the easiest way to manage and automate spreadsheet workflows. It helps: Share different sheets or even spreadsheet cell ranges with various collaborators without worrying about breaking references outside the selection Automate communication flows and keep track of your communication data, contributors and deadlines.Review every single change Made The Excel file and select which flashes with the spreadsheet or discard errors was caused by directly entering the data into the spreadsheet or by manually copying it and pasting it from other spreadsheets to your master file. Layer Automatically merges your files and will handle all changes accordingly. Sign up for early access and schedule an onboarding call to get started with the level right now! Financial leaders at Stackoverflow, Ironclad, Landing and more, share their intuitions, intuitions.
