Skip to Main Content Skip to Main Content Request Types Data Request For requestors who would like to apply to receive data only. A list of studies with available data sets can be found here Internal Request For requestors from the Parent Study for specimens to be used for the original study protocols. Ancillary Request For sample requestors who have an approved ancillary study. An ancillary study is defined as a study that uses the Parent Study subjects' data and/or biological specimens, but proposes research questions that are not addressed by the Parent Study and /or written into its protocols and procedures. In general, ancillary studies are characterized as being outside the specific scientific objectives of the Parent Study and are funded by a funding mechanism that is separate from the Parent Study funding mechanisms. Ancillary studies must be approved by the parent study. DNA Sample Request For sample requestors who are interested in applying for renewable samples (cell lines and whole genome amplified DNA) and clinical data from the NIDDK Repository. There is no need to submit a separate data request if you submit a request for renewable samples. A list of studies with available samples can be found here BioSample Availability Request Non-renewable samples are in short supply and NIDDK uses a grant mechanism for reviewing requests for these resources. The process considers the impact that each request has on the study's sample inventory. The Repository's online form allows you to submit your sample requirements to the Repository Staff, who will provide you with a report to include as part of your application for PAR-19-319. Please note that there is no need to submit a separate data request. Fluttering sails. Lapping waves. These are the sounds that surround Carina — the racing yacht on which I'll be sailing this month from Newport to Bermuda. As the least-experienced member of Carina's 12-person crew, I expect to spend many unpleasant hours tucked away in the galley or in the head.That's why I expect the microTalk handheld radio, from Cobra Electronics, to come in handy. Ultra-lightweight two-way radios with a two-mile range, Cobra MicroTalk units let a helmsman and a bowman trade coordinates without leaving their posts — on a private communication channel not available to competing crews.The microTalk Weather model allows landlocked users to get local weather reports — a valuable feature for hikers, skiers, and others who are susceptible to changing conditions.A single Cobra microTalk Weather unit sells online for about \$120. Visit Cobra Electronics Corp. on the Web (www.cobraelec.com).
