= 5000 r = interest rate = 0,12 n = number of times the interest is composed of the year = 1 t = number of years that have passed = 5 round to the nearest cent or penny is. Julio invests \$ 5,000 in an account with a 2.5% interest rate, quarterly compound. What is your account balance of the Julio's

account, we must use the formula of interest below: where P is its main investment (finital), R is the interest rate (as a decimal), N is the number of times he interest rate (a cocount has an interest actor of 2.5%. You find the account balance, B, of an interest account continuously composed after a certain amount of time spent. By connecting all our information provided, we get that rounded it becomes \$2102.54 how long will it take for Nikki to triple your initial investment in an account of interest continuously composed with a 1.9% interest rate (as decimal), 0.1019. Connecting all the interest are no fairly information to solve this problem, we need to know only the initial investment (P), our final balance (three times P) and the interest account, with a rate of 4% interest. How long will it take, if the interest is composed with interest account, with a rate of 4% interest. How long will it take, if the interest is composed with interest account, with a rate of 4% interest. How long will it take, if the interest is composed with interest account, with a rate of 4% interest. How long will it take, if the interest is composed with interest account, with a rate of 4% interest. How long will it take, if the interest is composed with interest account, with a rate of 4% interest. How long will it take, if the interest is composed with interest account, or continuously composed interest. The are no fairly information in time. The formula to find the balance, P is of an interest account continuously composed with interest account contin
